Condatis Credential Gateway – simplifying decentralized identity orchestration

The Condatis Credential Gateway © (CCG) is a decentralized identity platform that simplifies the orchestration of decentralized identity user journeys. The gateway is a system-neutral solution, providing verifiable credential capabilities in a common standards-based way, supporting easy integration with any verifiable credential or identity verification service provider without being locked in with a specific vendor.

Transforming how identity data is controlled, shared, and stored

With businesses accelerating their digital transformation, Condatis Credential Gateway offers organisations an opportunity to empower their users and enhance how data is currently shared and stored. With data governance and compliance challenges, organisations may face difficulties in several scenarios. CCG is an opportunity to streamline processes where:

- users are distributed, and mobility between physical sites is required.
- there is a diverse existing legacy IT ecosystem.
- there is a need for verifiable data from trusted partners.
- there is a need to enhance data security, privacy, and transparency for users and organisations.
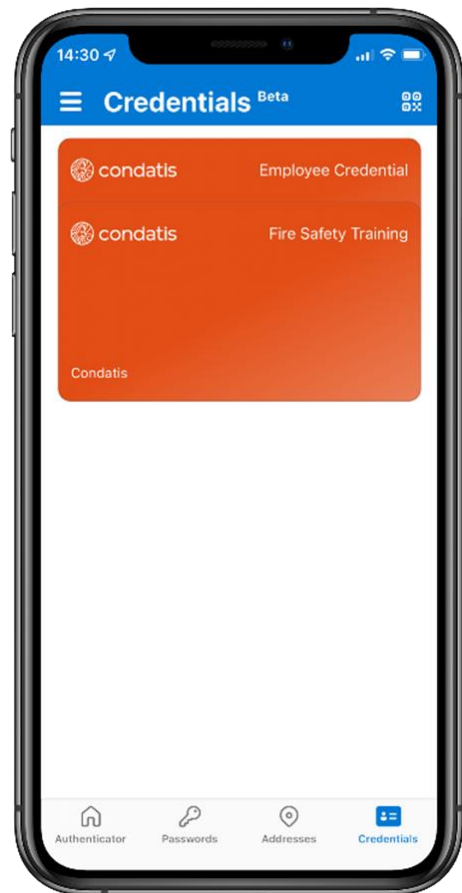

Our services

- Decentralized Identity Strategy Assessment to help you identify possible use cases for your business
- Use case workshops to focus on your business' candidate use cases.
- Detailed use case reporting and recommendations.
- Condatis Credential Gateway integration, training, onboarding, and development support.
- Exploration of decentralized identity training and staff passporting to enable your business to issue and verify staff and training credentials.
- Customised decentralized application build and user flow for specified use cases tailored to your business needs.

Why implement Condatis Credential Gateway?

Time: accelerating adoption of Verifiable Credentials to improve business processes, such as staff on-boarding.

Cost: no need to build a new interconnected system. Our gateway provides a trusted foundation for credential exchange built around your organisation's governance frameworks, allowing you to run autonomously while digital transactions occur.

Risk management: maintain better controls and logging within regulated or secure environments, such as training and health and safety.

Simplified integration: We work with your existing systems and current infrastructure – you don't need to start from scratch! You can integrate with multiple systems without disruption of services such as identity verification, audit logging, and internal data sources.

Flexibility: the gateway offers you the flexibility to support multiple use cases, facilitated through the same architecture.

A privacy-preserving system: Ensuring only the minimum data required by the service provider is disclosed.

Testimonials

protecting organisations, connecting people

"Condatis a Microsoft Gold Partner specialising in External Identity and Access Management (IAM), integrating Azure B2C into new and existing technology. They have worked with some of the largest enterprises and government departments globally always delivering the results that we expect from our Gold partners. The team at Condatis show their passion, dedication, and competency every time we engage with them, whether it's bringing them into a customer engagement or when we look for some thought leadership in this space. I would have no hesitation recommending Condatis as your IAM specialist partner to ensure a successful deployment."

- **Ciara Gallagher, Senior Program Manager | Identity CxP for ExIDs**

"I can honestly say working with you and your team has been a great experience from start to finish. I've worked with many vendors over the years and this has been one of the best engagements I've experienced. Aside from the competence of your team in delivering on time and on budget the integration of Condatis into our project team was such an easy and pleasurable process. I particularly liked how open and collaborative everyone in your team was and in particular your ability to see the project and challenges from our perspective"
- **Mike Walker, Technical Project Manager at Brewin Dolphin**

"To avoid any overlaps within our userbase, Defra have embarked on a project to provide all services digitally and provide a centralised Customer Identity and Access Management system. Condatis have come in to help us achieve our strategic objective to have a single customer record for all our customers, regardless of which service they access and a single login credential to make access easier and smoother. We have an extensive roadmap of different services that will be digitised and onboarded next. A solution like this would be suitable to support us in continually expanding the available functionality of the platform."
- **Claire White, Digital Deputy Director at Defra**
