

Freedom to stop and start at each point of your journey

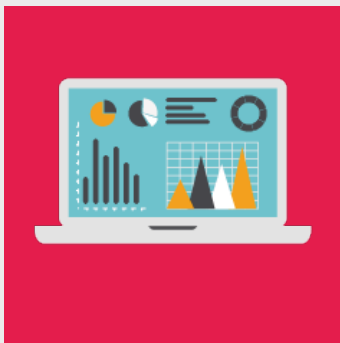

Specialist tooling to help plan your migration to the Cloud

Our service allows you to plan at every stage and progress at your own pace. We can migrate 1 server or hundreds, depending on how quickly you want to proceed. If you have a delay then the service can be put on hold until you gather pace again.

Typical challenges	How we respond
Business value and need	We provide strong leadership and business integration during the planning process
Lack of Expertise and high complexity	We provide the expertise needed and reduce complexity using our proprietary toolsets
Spiralling costs	We provide full visibility of the costs associated with migrating to the Cloud so you can balance this out and keep control of your overall migration costs
Security and Privacy	By using security applications, encrypted file systems, data loss software alongside detailed planning using toolsets to identify the best move groups

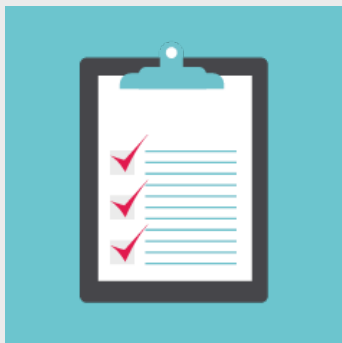

The result: A smooth and secure process.

Planning & Integration Software

Automation during migration

Simple & understandable methods

Illuminet Cloud Migration as a Service

Plan and automate your journey to the Cloud efficiently, successfully and in the shortest time possible

Our plan of action

4 Critical areas of focus

Discovery - Knowledge of infrastructure and applications currently running

Assessment - Defined complexity of applications with a look at costs and services to migrate

Planning - Toolset to collaborate with application owners, with a plan in line for testing and movement into the Cloud

Migration - Automated migration of servers and applications to the Cloud

We have the ability to discover, assess and plan the migration without the need to create a large team of migration specialists. Due to the technicalities of Cloud deployment, if your project stalls then the service can be stalled also. All data will still be available.

Our goal is to do the heavy lifting.
