G-Cloud 14 Services Definition

LARGE SCALE WEB APPS

We are specialised in building the next generation of digital products.

By leveraging the latest UI technologies and architectures, multi device techniques, big scale applications, component based system, intelligent user interfaces, and the latest trends on user experience.

OUR PURPOSE

We create engaging products providing a set of UI practices and technologies through interactive interfaces, delivering the same experience in a frictionless way.

We build interfaces awarded of users, from context to context, device to device and acts proactively making the experience simpler, leaner, faster, and suggesting new behaviors based on their interactions.

LARGE SCALE WEB APPS

To power digital transformations one needs to create omnichannel solutions. This is done building responsive and scalable web applications following different approaches, from single page to server side rendered applications with a loosely coupled, modular, component based architecture, mobile-first and SEO friendly techniques among other best practices.

LARGE SCALE WEB APPS

Single Page Applications

An **SPA** is a web application that fits on a single page rather than the more traditional Multi-Page Websites. In an SPA, different content can reside in different 'states' of the page, instead of requiring a new page. One modern example of an SPA that many Internet users are familiar with is [Gmail](#).

PWA

Micro Frontends

Features

- Different content can reside in different 'states' of the page, instead of requiring a new page.
- Local storage capabilities of storing data on a browser for performance
- Modular, reusable and reproducible. Better for productivity and testing..
- Offline mode supported
- One page can have different states, emerging the use into one only experience shared across all the application.
- No page transition to deliver a better and more fluid user experience.

LARGE SCALE WEB APPS

Progressive Page Applications

Moving the mobile experience to the web.

Progressive Web Apps are installable and live on the user's home screen, without the need for an app store. They offer an immersive full screen experience with help from a web app manifest file and can even re-engage users with web push notifications.

LARGE SCALE WEB APPS

Micro frontends Architectures

Extending the microservice idea to frontend applications

The term **Micro Frontends** is a derivative of the microservices approach. It represents the architectural approach for the composition of multiple self contained and loosely coupled UI components (services), where each component is responsible for a specific UI element and / or functionality.

Features

- **Technology Agnostic.** Each team should be able to choose and upgrade their stack without having to coordinate with other teams
- **Isolate Functionality** Each piece of the frontend contains an own functionality meaningful for the application
- **Isolate Team Code.** Build independent apps that are self contained

LARGE SCALE WEB APPS

Server side rendering

Universality, sometimes called “isomorphism”, refers to ability to run nearly the same code on both client and server.

Because of this, you can write the code once and then execute it on the server to render static pages and on the client to allow for fast interactions. Most popular implementation is adopting Node.js. Sharing code between the client and server is becoming a more common and natural choice.

express

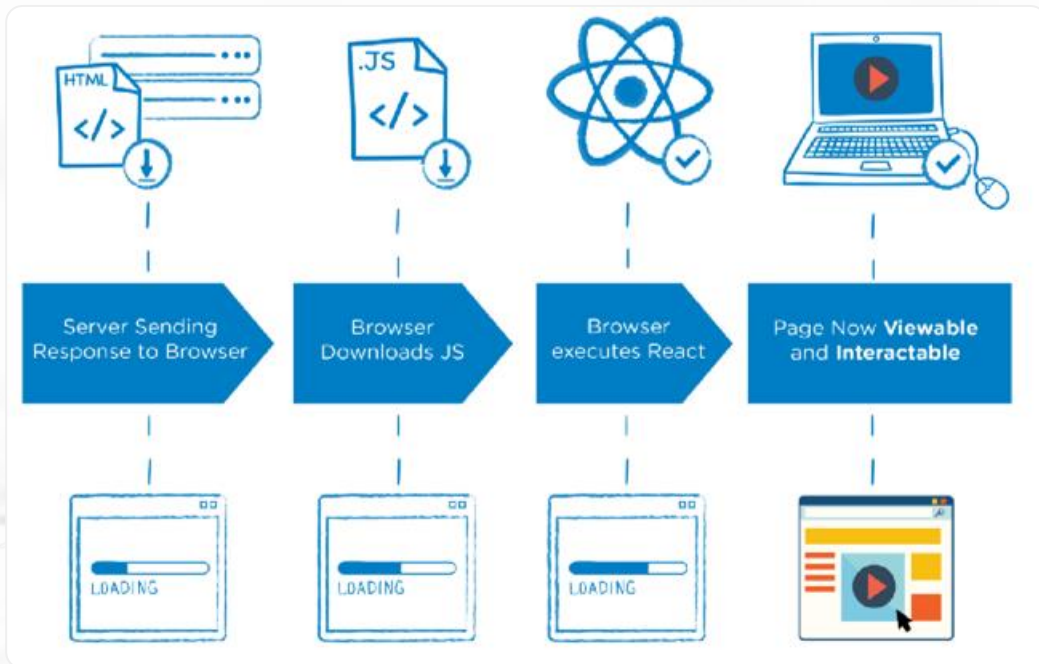

There more frameworks and libraries for server side rendering like **Rendr** (Backbone server side), **Derby**, **Este.js**, **Mootools**, **Chaplin** among others.

LARGE SCALE WEB APPS

Reuse

A component oriented Architecture allows reusability of base code.

NPM ecosystem allows us to share all kind of modules, from components to configuration packages.

This enables version management for modules, providing control over base code.

Features

- Allows code sharing between projects
- Provides code stability due to version management.
- Packages usage enforces organization, what means more quality in the end product.
- Allows to propagate changes across all different projects.

LARGE SCALE WEB APPS

Seeds & Tooling

Seeds, like the ones used by Yeoman, provides shared project basements with shared boilerplates and faster kick off for new projects.

All tools used by projects are provided with a shared seed:

- Webpack is a build tool to handle assets and more as a dependency graph. Making easy and manageable big loads of assets and sources for your SPAs.
- Gulp is a task manager to define custom tasks matching the business needs in order to create and build SPAs. Requires support from other tools.
- Babel compiler. Allows to use the latest JavaScript features without sacrificing compatibility.
- Karma runs all your tests to get a fully continuous and progressive output on the project integrity and stability.

LARGE SCALE WEB APPS

Frameworks

Having a good foundation increases productivity, quality and delivery.

JavaScript web frameworks became like a silver bullet for quick web app development. They serve as a web applications, allow developers to worry less about code structure or maintenance while focusing on creation of complex interface elements, and expand opportunities of JS and plain HTML. Having a big community support allows us to ensure high level quality in all our projects.

Advantages of using Javascript frameworks (or libraries)

- **Efficiency** – projects that used to take months and hundreds of lines of code now can be achieved much faster with well-structured prebuilt patterns and functions.
- **Safety** - top javascript frameworks have firm security arrangements and are supported by large communities where members and users also act as testers.
- **Cost** – most frameworks are open source and free. Since they help programmers to build custom solutions faster, the ultimate price for web app will be lower.

LARGE SCALE WEB APPS

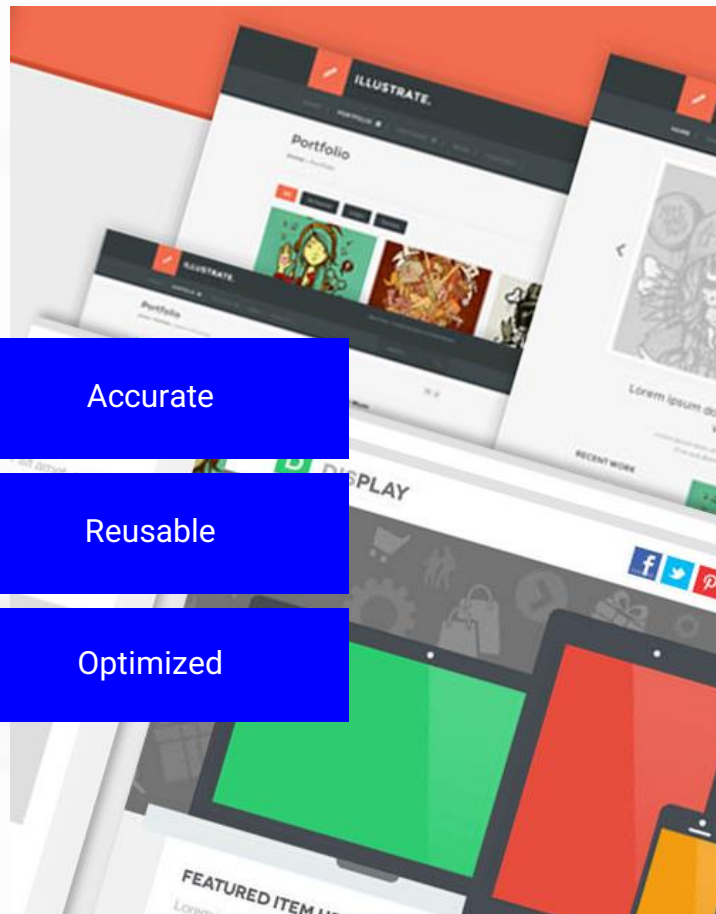

Pixel perfect

What does "pixel perfect" mean?

If someone says "**I want a pixel perfect implementation of this design**", he refers to create a HTML page which looks exactly like the design - down to every pixel.

To make it possible we have expert teams for each project in each area, that will be with you from the scratch until the implementation:

- Pixel Perfect Visual Designer.
- Pixel Perfect Tester.
- Pixel Perfect Developer.

LARGE SCALE WEB APPS

Performance

A good performance, with the addition of good interface means better and smoother user experience.

Applying good performance practices is always a must to create the best quality and reliable products.

- We generate production ready builds to increase product performance and stability.
- We generate deterministic builds to ensure the best quality and performance optimised products all times.
- We apply the best practices to reduce load times.
- We use the most performant animations to ensure smooth user experience.

LARGE SCALE WEB APPS

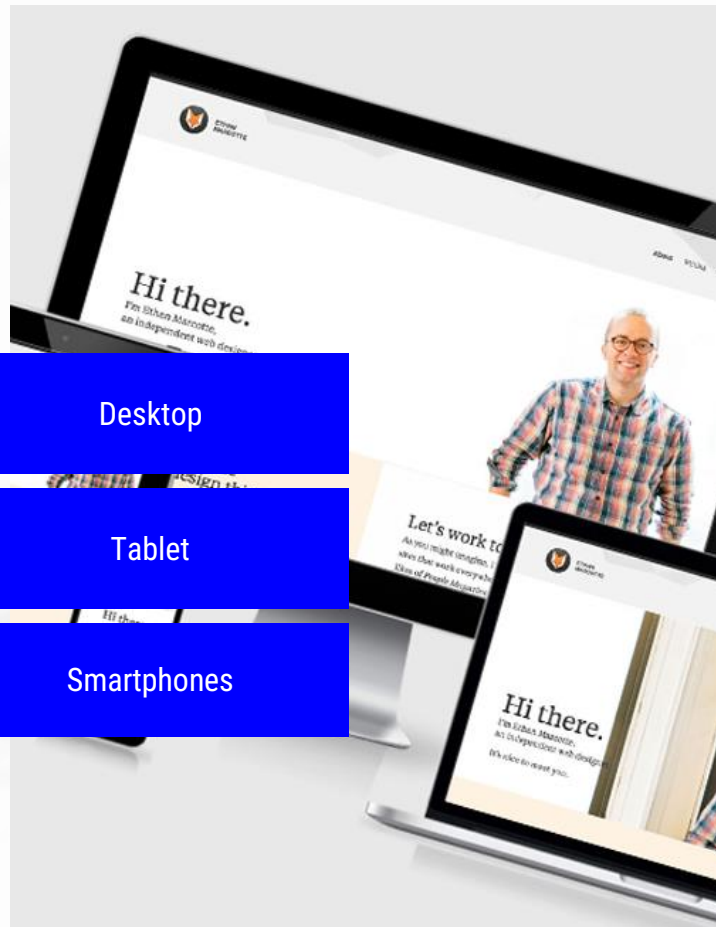

Responsive

Due to the proliferation of smartphones and tablets in the current market, there are more diversity than ever of screen sizes.

This situation forces us to create intelligent websites to cover all of them, for that we use the latest technologies and tools available in the market.

- Frameworks: Bootstrap - Material design - Foundation.
- Preprocessors: Sass - Less.
- Tools: PerfectPixel - Browserstack.

LARGE SCALE WEB APPS

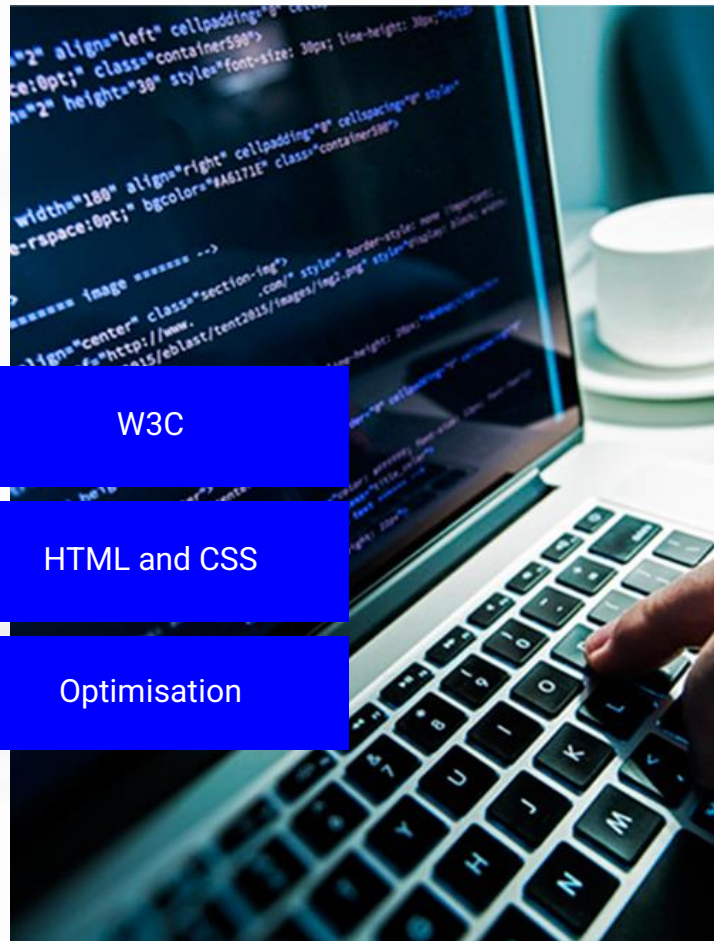

S.E.O

Have a good positioning in search engines expands the possibilities for growing of a company.

This is achieved by using several techniques when we build a website, which are intended to increase the traffic and the visibility that it has.

In this practice we develop thinking in the semantic HTML, we advice for content creation and follow our implementation with SEO audit.
