

Unlock the possibilities of mobile at work

Unlock the possibilities of mobile at work

Transform how employees work, by transforming your mobile devices.

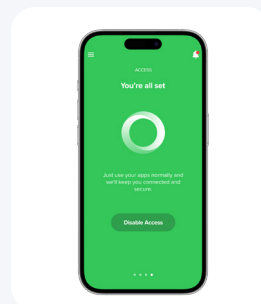

Do more with mobile devices

Organizations seeking to innovate their processes often adopt workflows that integrate mobile devices. However, complex requirements across a broad spectrum of mobile use cases makes it challenging for devices to reach their full potential. Too often, organizations use disparate tools alongside their primary (typically UEM) tool – resulting in a fragmented user experience and stalling projects.

With [Jamf for Mobile](#), organizations get all the capabilities needed to unlock mobile's power at work – letting mobility teams meet security and compliance requirements while improving the user experience.

Jamf for Mobile enables mobility teams to:

- Extend workflows with secure access to critical applications anywhere employees work.
- Provide mobility and security teams visibility and control to protect devices while preserving native mobile experiences.
- Enable both 1:1 and shared device assignments and use cases.
- Establish baselines to stay compliant with organizational and regulatory frameworks.

Key Capabilities to plan, deploy and scale workflows

Device Management

Zero-touch deployment automatically configures and customizes devices, empowering your team to work more efficiently and accelerating user productivity. Easily deploy, patch and customize apps on any mobile device.

Endpoint Compliance

Establish a secure baseline and validate that every mobile device complies with regulatory requirements. Monitor for vulnerable app versions, app risk level, out-of-date operating systems, plus block or hide unauthorized apps, and more.

Mobile-first Experiences

Deliver the native experience users expect with a solution built for Apple frameworks. Jamf provides extended support to solve cross-platform challenges and securely manage major operating systems, ownership models, and form factors.

Web Protections

Protect users from online threats (like phishing) and enforce your organization's Acceptable Use Policies with advanced web protections. Manage cellular data consumption through Data Capping and control access to restricted content with Content Filtering, ensuring safe and compliant browsing across all apps and browsers.

Threat Detection and Response

Protect your organization's data with real-time detection and rapid response. Use Data Streams to send critical threat events, network traffic, device data and app insights directly to your SIEM, and use Threat Risk Signalling to swiftly remediate emerging mobile threats.

Secure Application Access

Enable employees to work effectively from anywhere by providing seamless access to critical applications when they need them. Zero Trust Network Access and identity automation integrations ensure that only trusted users on approved devices can access work resources.

Jamf +1's

Streamline and enhance your Apple and mobile workflows. Jamf-built apps enable unique industry workflows that provision, customize and refresh devices for any user or use case – primarily for shared-devices. Gain insights into device usage and deliver a tailored, native experience for frontline workers.

Key Industries

Jamf works with leading organizations to deploy Apple devices in Healthcare, Retail, Manufacturing, Hard Hats and Aviation industries.

Industry Experts, Services and Partners

Jamf's mobility and Apple experts partner with your team to pinpoint the ideal solution for your needs. Our [Marketplace](#) partners enhance the power of Jamf with pre-built solutions, while Jamf Professional Services accelerate your organization's adoption.
