Managed Detection & Response (MDR) including XDR & EDR

Our managed solution collects and analyses security events within your network.

Service Overview

CND's Managed Detection & Response service combines several cyber security services into one simple, affordable and scalable solution.

It collates security events from within your internal network as well as your cloud services. The aggregated data is then securely transferred to our Security Information & Event Management (SIEM) platform for analysis which is carried out by Security Analysts, on duty 24/7, from our Security Operations Centre (SOC).

Deliverables

As a SOC managed service client, you receive:

1. Notification of any significant events as they happen.
2. Expert analysis.
3. Weekly customised reports.
4. Read-only view of SIEM platform.

Service Details

Virtual sensors will be installed within your network to collate events from a variety of sources. The service offers a wealth of capability including, Intrusion Detection Systems (IDS) and vulnerability scanning.

Unlike similar solutions, the CND service is "Single Tenant", meaning it will only contain your security data. We can provide you with near real-time visibility of your security events. Our platform also monitors cloud services such as Office 365, G-Suite, Azure and AWS.

Another advantage of this service is its scalability, the storage can be increased or reduced depending on your requirements.

CND's service can be extended to include XDR and EDR.

Pricing

Pricing starts from £799 per month, based on a 12-month subscription.

Pricing is based on the amount of cloud storage required and the length of time you require access to near real-time events.
