

# ON-PREMISE SOC SERVICES

We can build an on-premise SOC for your organisation – either in part or in its entirety.

## SERVICE OVERVIEW

When it comes to delivering an on-premise SOC, CND's wealth of experience enables us to be innovative, flexible and agile. CND have experience of working with all Security Information & Event Management (SIEM) including but not limited to MS Sentinel, ArcSight, LogRhythm, AlienVault, QRadar, McAfee ESM, Splunk, ELK Stack, Exabeam & Securonix.

Using a modular approach, clients have total control over how extensive the involvement of CND experts is in building their SOC – from contributing in part to the entirety.

## DELIVERABLES

The on-premise SOC will be tailored to your needs, and may include but not be limited to:

- Requirements capture
- Product selection
- Configuration
- Tuning
- Monitoring
- Staffing solutions
- SOC operations

## SERVICE DETAILS

When delivering a SOC to our clients, there are several phases to consider, such as requirement capture, product selection, implementation, configuration, tuning and monitoring. We are happy to deliver any or all of these elements. The same flexibility is applied to whether we transfer ownership to the client and at what pace.

The human element should also be considered: this could be provided entirely by CND, or just in part. Utilising our cyber security recruitment team, we can provide contractors or even permanent staff.

Other human considerations are training, engineering, hours of operation and shift patterns. After the SOC is built, CND can man the SOC on the client's premises on their behalf (or with client oversight). We also have a number of proven processes for handing over the SOC to the client. Another solution is for the SIEM to be in the Cloud and for the monitoring to be on-premise.

## PRICING

Variable depending on CND involvement, size and scale.

Following a scoping consultation, a comprehensive proposal outlining the price of each selected module will be provided.
