

Definition of Services

Mobile App Development.

Apps · Software · Websites

Company Overview

Since our founding in 2005, we have built a reputation for designing and developing high quality, innovative software for startups and established brands that offer their end-users the best possible experience.

With clients across the globe, from the US, Europe, Asia across to Australia, working in multiple sectors including Built Environment, Education, Healthcare and Social Services. With a team of 18, we work hard to ensure we're an integral part of our client's workforce. Our experienced team can support you on a range of services across web, mobile, and back-office.

Our Approach

We adopt a hands-on approach. Our aim is to fully understand the needs and requirements of our clients and to work together with them to develop an appropriate web strategy. When speaking to our clients we do not use complex technical jargon, always ensuring that they fully understand all aspects of our service and are completely satisfied with the end result.

We are contactable and approachable, most importantly we work hard to make sure the clients get what they want.

Mobile App Development

Are you looking to commission a new mobile application on either iOS or Android? We can help!

We have worked with our existing clients on everything from nutritional assessment IOS applications to news aggregation and accessibility applications built for Android.

However large or small your project Arch can help convert your initial ideas into a full functional specification before adopting a strictly agile development plan, working with you right up until and after your application is released.

Flutter

Flutter is a hybrid framework created by Google in 2017 that combines the efficiency of cross-platform development with the natural and robust nature of native development.

It enables us to design and build apps for both iOS and Android using the same codebase, reducing development times in some circumstances. Flutter enables the design of flexible and expressive UI, and it certainly delivers on that promise.

Developers can create amazing user interfaces thanks to a diverse set of reusable, configurable widgets. Furthermore, the inherent features of Flutter enable a smooth user experience and top-tier app performance.

Why Flutter?

Flutter, being a cross-platform mobile development solution, significantly shortens app delivery time. Because it makes one code reusable across two target platforms, it helps businesses minimise delivery time and grab audiences on both Android and iOS. Working with one codebase rather than two always helps to reduce total project costs; hence, cost efficiency is one of Flutter's most enticing aspects. The technology enables considerable savings by simplifying development and cutting app delivery time, increasing the application's return on investment.

What do our development processes achieve?

Following the completion of the development phase, you'll receive a version of your application that is ready for both user and diagnostic testing. When it comes to this, we continually work to maintain the highest levels of security for all aspects of our development, launch and hosting services. That's why we've undertaken the UK Government-backed Cyber Essentials Plus accreditation across our organisation and boast ISO9001 and ISO27001 accreditation at a data centre level.

Throughout the project process, design and code is regularly tested against industry-leading practices, ensuring the product is delivered to you for client and user phase testing in its most complete and robust state.
