

Intelligent Features - SIP Connect

Connect your analogue and SIP registered devices to your cloud telephony environment, reducing the need for separate connections and services.

What is it?

SIP Connect is an add-on service to Pure IP's Managed Voice service that allows you to connect analogue and SIP registered devices through the use of SIP end-points.

Not to be confused with a SIP Trunk, SIP Connect works by creating a single SIP end point in the Pure IP voice network to which SIP registered devices*, such as Video Conferencing (VC) units, and ATAs (Analogue Telephone Adapters) can be connected to consolidate services and reduce the need for and management of separate services. One SIP end point per device.

SIP Connect utilizes a username and password authentication to link devices rather than public IP, providing additional flexibility to change the location of connected devices.

Where is it used?

SIP Connect is ideal for organisations who have or are migrating telephony to the cloud with platforms such as Microsoft Teams, or are replacing traditional PSTN services with SIP and need to connect on-premises devices such as fax machines, tannoy, paging and door entry systems, DECT phone and VC units.

Note: The following analogue devices are not currently supported: Lifts; Alarm systems; Credit card/payment machines; Banking machines; Emergency/back-up phones.

Benefits

- Consolidates services and management
- Unified user experience
- Flexibility to relocate devices
- Integrated service

Associated Services From Pure IP

Pure IP have a range of additional solutions to help you optimize your Teams voice services, ranging from core Voice Managed Services, additional Cloud Enablement services, Contact Center integration, SBC Managed Services and legacy call related application integration. Speak to you local Pure IP representative for further information.
