

HiScribe utilises AI to save and code clinical notes from clinical consultations and dictation

Built for the NHS and fully assured

Save time, every time

Focus more time on care

Powered by Huma Intelligence

Available for FREE

Create appropriate documents in seconds

HiScribe can generate a saving of upto 30% on every clinical consultation - this improves the quality of patients consultations and creates valuable capacity for practices.

Our unique model means that HiScribe is available for FREE to all users.

Four simple steps

Summarise consultation

Before you start, you must inform the patient you are using a tool to help transcribe and summarise the consultation to assist with note-taking.

How can I help you today? I've come in about my skin. I've had what I think is eczema for years, but it's really flared up lately, and it's driving me mad. I see. Can you tell me exactly what it looks like and where it's affecting you most? Sure. It's mainly on the backs of my knees and inside my elbows. It's very red, dry, and feels rough. The worst part is the itching, especially at night. I wake up scratching, and sometimes I even bleed a little. That sounds very uncomfortable. When you say it's flared up lately, has anything changed in your routine? New soaps, detergents, or perhaps a lot of stress? I haven't changed my washing powder, but I've been using more hand sanitizer at work, and I've also been quite stressed recently, so maybe that's it. That's a common trigger. Eczema often reacts to irritants and stress. So, let's talk about treatment. Have you been using anything for it so far? I use a thick moisturizer from the chemist, but it only helps a little bit. That's a great start. The most important thing with eczema is to keep the skin moisturized constantly. We call those moisturizers 'emollients'. You should use yours generously, at least two or three times a day, even when your skin feels better. Okay, I can do that. For the current flare-up, we need something stronger to settle the redness and itch. I'm going to prescribe a mild steroid cream. This is a specific medicine designed to reduce the inflammation. A steroid cream? Is that safe to use? It is, yes, as long as you use it correctly. You only need to apply a very thin layer—just enough to cover the red areas—once a day for about one week. Once the redness and itching calm down, you stop the steroid and go back to just your moisturizer. It's meant for short, sharp bursts. I'll also give you some advice on things to avoid, like long, hot baths, which can dry the skin out. Try to use a soap substitute rather than regular bar soap, which can be too harsh. That makes sense. So, a new steroid cream for the flare-up, and keep using my thick moisturizer constantly. Exactly. I'll print out a care plan for you. If your skin hasn't calmed down significantly after a week of using the steroid, or if it starts to look infected—things like weeping, crusting, or feeling very hot please book another appointment to see me, or speak to the nurse. Thank you, Dr. Chen. That's very helpful. You're very welcome, Sarah. The prescription will be ready at the pharmacy. Take care.

Consultation Summary

Eczema Flare Management

Help us improve Edit Copy

Presenting complaint

- Patient presents with a long-standing history of eczema, which has recently flared up significantly, causing intense itching, particularly at night.

Past History

- Patient reports a history of eczema for several years, primarily affecting the backs of knees and inner elbows.
- Recent triggers may include increased use of hand sanitizer and stress.

Treatment plan

- Continue generous use of emollients at least twice daily.
- Prescribed a mild topical steroid cream to be applied thinly to affected areas once daily for one week to manage the current flare-up.
- Advised to avoid long, hot baths and use soap substitutes.
- Review if no significant improvement after one week or if signs of infection develop.

SNOMED Codes

Huma intelligence is generating additional relevant SNOMED codes...

- **Generate summaries of consultations between patient and clinician**
- **Code vital measurements directly from Hi Scribe**
- **Generate suggested SNOMED codes aligned with QOF business rules for the current financial year**
- **Fine-tuned integration with EMIS Web and SystmOne**
- **Create your own templates to format the summary however it suits you, and be able to share these with everyone in your practice**
- **Copilot to support with editing produced summaries**
- **Manual ability to edit and format a summary**
- **Generate content suitable to be included in a referral letter and a patient-facing consultation summary**
- **Dictation only mode to support note generation after the consultation has finished or if the patient didn't want to be recorded**

Next:

- **Provide a summary of the consultation to the patient for their own record**
- **Recommended self-help and self-care guidance to share with the patient**
- **Broader template set**

Research:

- **Pull context from the patient record to enhance efficiency and accuracy of the consultation**
- **System audio capture - telephone integration**
- **Specific document templates to be populated**
- **Match clinician "style" when capturing and generating notes**
- **Pull relevant online consultation data (specific to eConsult Online Consultation users)**
- **Recommend onward activity and generate task capability**
