

Protect the expanding attack surface with Red Sift ASM

With Red Sift ASM (Attack Surface Management), you can continuously discover, inventory and manage your business's critical external-facing and cloud assets.

Get complete visibility

Get a view into your entire attack surface – including assets you didn't know existed.

Fix proactively

Be aware of and remediate configuration risks before bad actors can take advantage.

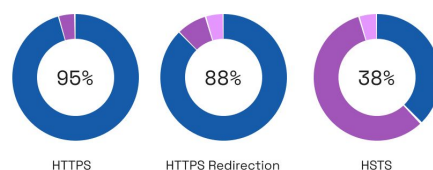

Reduce cyber insurance costs

Solve problems before they are visible to your insurer and reduce cyber insurance premiums.

Leverage unmanaged attack surface data

Identify mismanaged or unmanaged assets that other tools miss. Red Sift ASM continuously scans domains, hostnames, and IP addresses so your data is always fresh.

Web Application Configuration

Automated asset inventory

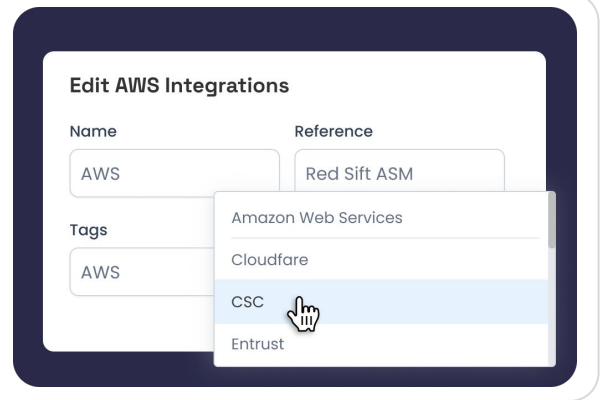

Build an inventory of your external-facing and cloud assets without spreadsheets or manual processes. Connect to cloud providers, certificate authorities, registrars, and managed DNS providers to import and monitor all of your assets.

Hosts

Hostname	EMAIL		
	TLS	DANE	SPF
Securelyparked.com	✗	✓	✓
api.securelyparked.com	✗	✗	✗
dev.securelyparked.com	✓	✓	✓

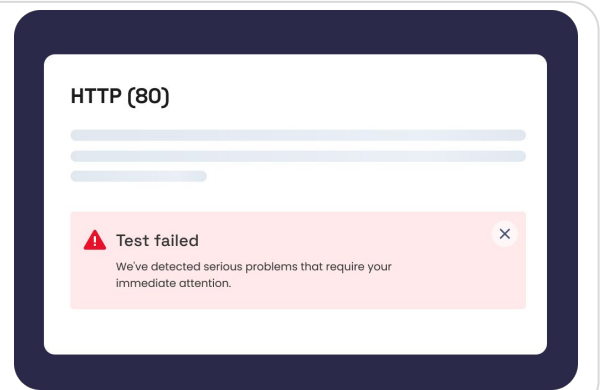

Get complete visibility into cloud accounts

Integrate with AWS, Google Cloud and Azure out-of-the-box for a more holistic view of the entire attack surface.

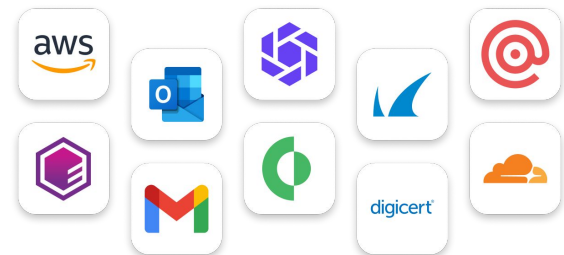

Information to take action

In-depth, real-time data about each asset makes it straightforward to take action as soon as a misconfiguration or unmanaged asset is identified.

Integrate and automate at scale

Connect ASM to your existing tools and workflows. Use our APIs and events framework to automate asset management and receive real-time notifications where your teams already work.

Leading security teams trust Red Sift.
