

Tool selection, transition and cloud service integration

iCore is an independent IT Transformation consultancy, providing pragmatic approaches to help our customers develop their management and delivery capabilities for cloud-based services delivering today's high velocity IT services.

Our consultants continually face challenging and varied delivery assignments, finding new and innovative ways of managing and delivering IT & digital services.

Using this knowledge, we advise, prepare and improve our customers service delivery models to deliver their cloud service implementation or transition objectives.

You can trust that we know what to do, when to do it, and how.

Modern IT service management for cloud services

Many organisations view moving to the cloud as just a “technology” change.

Migrating to cloud-based services and infrastructure impacts all dimensions of service delivery, including people, process and partners, as well as the technology management methods.

We support your cloud transformation journey by identifying and embedding the service and organisational changes needed to fully realise the cloud and digital outcomes your organisation requires.

Our approach

Determine relevant delivery readiness factors that are needed to meet your organisations cloud migration objectives

Assess current delivery against these identified readiness factors to target specific areas requiring improvement

Define an overall roadmap of change to improve your service delivery to assure that the desired outcomes can be obtained to support your cloud migration

Create and deliver action plans against the roadmap preparing your organisation for managing ongoing delivery of your cloud services

Tool selection, transition and cloud service integration

Features

- Grounded in iCore's extensive experience of evaluating and providing support for ESM/ITSM tooling across several organisations.
- Reviews your ESM/ITSM, cloud and enterprise tooling landscape to identify capability improvements or integration needs to provide holistic cloud service governance, management and reporting.
- Establishes a framework for integrated service databases (CMDDBs) that can effectively manage your organisation's cloud service assets alongside your existing assets.

Benefits

- Accelerates requirements definition for new tooling, across or between ITSM and ESM practices.
- Takes advantage of modern tooling capability such as self-service, robotic process automation (RPA), and virtual assistants for 'shift left' optimisation.
- Integrates existing tooling or identifies further integration opportunities to enable improved orchestration across your service supply-chain and SIAM service delivery models.
- Enables self-service portals focused on Customer Experience (CX) to provide access to service information and reducing support demands.

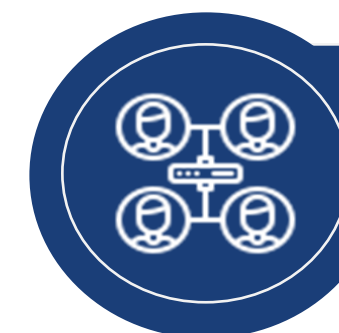

We help companies navigate their way through major change successfully, providing first-hand experience in guiding people through the 'change curve'

Over 25 years of delivering Pragmatic Service Management consultancy – always learning better ways of embedding best practice & passing this knowledge on

Modern thought leadership & approaches to help organisations embed Modern Service Management to align with the demands of a digital, unpredictable & agile world
