UST FORTUNA

Bring Cloud To Your Data Center

UST FORTUNA

- UST FORTUNA® is a Private Cloud offering built entirely with open-source components, that is right-sized for managing complex enterprise workloads and developing cloud-native applications.
- Its rich API interface helps integrate to existing tool ecosystems, protecting the customers from enterprise investments and allows seamless onboarding into their compute environment.
- Built with integration capabilities for Multi tenant environment with Availability Zones based on Hypervisors, GPU Farms and Infra Components.
- It has built in capabilities enabling self-sustaining cloud operations, while maintaining the performance requirements for critical business operations.
- The Ubuntu based Opensource Openstack cloud also comes with containerized features like Docker & Kubernetes.
- Fortuna works on commodity hardwares in a highly secure environment, bringing significant cost benefits to the customer, eliminates the risk of vendor lock-in and integrates with multiple automation tools.
- Seamless Migration from existing infra to Fortuna using tried and tested migration tools.

Why Fortuna

- Fortuna provides flexibility that allows support for multiple hypervisors including KVM, Hyper-V and ESX.
- As an opensource platform running on KVM, Fortuna eliminates expensive licensing fees, reducing the total cost of ownership.
- Fortuna is designed to run on commodity hardware, thereby reducing costs for server infrastructure.
- Fortuna is a modular architecture and highly customizable, that helps to enable the platform with only the required services based on feature requirements.
- Easy scalability of compute nodes to cater to additional demands of resource requirements.
- Fortuna includes enhanced security features with granular access over network policies and privileges.
- High availability & Automated recovery features are built into the platform to help prevent outages and ensure faster recovery.
