CIRDAN CORE LIS

A description of the System and services provided is included in the accompanying service definition document for the Cirdan Core LIS application.

Cirdan provides a range of services to organisations procuring the Core LIS application, delivered by experienced resources with proven delivery across UK pathology environments. Services support system implementation and ongoing operations from onboarding through to post Go-Live.

Implementation services may include project planning, system configuration, validation and testing, customer training, data migration, UAT, go-live activities and post-go-live BAU support.

There are a significant number of different variables that healthcare organisations have in their requirements for a clinical system of this nature, e.g. number of interfaces and types of third party clinical systems, number of interconnected sites etc. Due to this the prices illustrated below are a maximum for the services listed and specific pricing can only be provided once the specific requirements of each individual NHS Trust and/or healthcare organisation can be determined.

The Cirdan Core LIS solution is granular in the configuration of the workflow screens and in the roles and permissions of the users. These configurations will form part of the specific requirements of each individual NHS Trust and/or healthcare organisation.

Please contact us for a quotation based on your specific requirements.
