| <b>Cloudflare Access</b>             | <p>Cloudflare Access determines who can reach your application by applying the Access policies you configure.</p> <p>An Access policy consists of an Action as well as rules which determine the scope of the action. To build a rule, you need to choose a Rule type, Selector, and a Value for the selector.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <a href="https://developers.cloudflare.com/cloudflare-one/access-controls/policies/">https://developers.cloudflare.com/cloudflare-one/access-controls/policies/</a> |
| <b>Cloudflare Secure Web Gateway</b> | <p>Cloudflare Gateway, our comprehensive <a href="#">Secure Web Gateway ↗</a>, allows you to set up policies to inspect DNS, Network, HTTP, and Egress traffic.</p> <ul style="list-style-type: none"> <li>• <b>Packet filtering</b> inspects and filters unwanted traffic based on packet attributes. Packet filtering policies block threats regardless of user or session context.</li> <li>• <b>DNS policies</b> inspect DNS queries. You can block domains and IP addresses from resolving on your devices. For more information on DNS filtering, refer to our <a href="#">Learning Center article ↗</a>.</li> <li>• <b>Network policies</b> inspect individual TCP/UDP/GRE packets. You can block access to specific ports on your origin server, including non-HTTP resources.</li> <li>• <b>HTTP policies</b> inspect HTTP requests. You can block specific URLs from loading, not just the domain itself. For more information on URL filtering, refer to our <a href="#">Learning Center article ↗</a>.</li> <li>• <b>Egress policies</b> inspect traffic to assign egress IP addresses unique to your organization.</li> <li>• <b>Resolver policies</b> inspect DNS queries to enable resolution by custom authoritative nameservers.</li> </ul> | <a href="https://developers.cloudflare.com/cloudflare-one/traffic-policies/">https://developers.cloudflare.com/cloudflare-one/traffic-policies/</a>                 |
