CSA Overview

Through analysis of your organisations security controls, policies and governance, the CSA assesses your organisations cyber maturity across technology, people, and processes

The Cybanetix Security Assessment (CSA) is a comprehensive framework designed to evaluate an organisation’s cybersecurity maturity across its technology, people, and processes.

Delivered by Cybanetix in-house security and compliance experts, the CSA provides actionable recommendations to enhance security posture, align with industry standards, and achieve compliance goals.

What issues does the CSA address?

The CSA framework assesses an organisation's current cybersecurity maturity, identifying weaknesses in existing security controls, policies, and processes. This service helps organisations improve their overall security posture and alignment to applicable compliance standards such as ISO27001, NIST, and Cyber Essentials.

What is our solution?

The CSA provides organisations with a structured and comprehensive evaluation of their cybersecurity maturity, delivering clear, actionable insights to enhance overall security posture. By assessing key areas across technology, people, and processes, the CSA identifies vulnerabilities and gaps in security controls and working practices that could expose the organisation to risk.

This assessment is tailored to the organisation's risk appetite, ensuring that recommendations align with business priorities and compliance requirements. The CSA not only highlights weaknesses, but also provides a strategic roadmap for improvement, helping organisations strengthen their defenses, achieve regulatory compliance (if required), and develop a proactive approach to cybersecurity resilience.

Features of the service

The CSA is beneficial for organisations of all sizes. From those with basic IT infrastructures to complex enterprises. It is particularly valuable for those aiming to achieve certifications such as ISO27001, PCI DSS, or Cyber Essentials as well as for organisations looking to acquire new businesses where cyber risk may be unknown.

The CSA evaluates across 20 key areas spanning people, processes, and technology. This holistic approach provides organisations with a clear, data-driven understanding of their overall security maturity.

Unlike generic assessments that rely on automated checklists or broad industry benchmarks, the CSA delivers tailored recommendations that align with an organisation's specific security needs.

Each assessment is conducted by Cybanetix security professionals. This expert-driven approach ensures that findings are not only insightful, but also practical and actionable, allowing organisations to make meaningful improvements.
