

Bug Bounty

Service Overview

Bug Bounty Programs are created to allow Security Researchers to report new security vulnerabilities directly to the company that owns the code. This allows the company to remediate the vulnerability before it can potentially turn into a major data breach and help reduce the risk of any financial or reputational costs.

NCC Groups Bug Bounty Managed Service is available to Clients, regardless of which Bug Bounty platform they are using. NCC simply join the platform and take over the management of your bug bounty programme in line with the service you have purchased from us.

There are three Bug Bounty Managed Service options available from NCC's which are available independantly of each other:

- Vulnerability Triage
- Security Assessment
- Programme management

Why would a customer need it?

Companies of all sizes are exposed to the ongoing risk of being compromised by malicious attackers. They recognise the value of harnessing the many hundreds of thousands of security researchers around the world who can provide the expertise, scale and breadth to identify the vulnerabilities first, and then report them to the customer for compensation. This is significantly less costly than the potential cost of being targeted by a successful ransomware attack, or a breach which results in customers' personal information being exposed.

Indicators of need

The Client is already doing application testing, has an effective bug mitigation program, and receives bug reports from multiple sources. The Client is struggling to identify vulnerabilities in their applications quickly and efficiently due to having a small or overwhelmed security team. They are struggling with the management of these multiple bug sources and their remediation lifecycle in a timely manner. The Client needs support and guidance in interacting with researchers, as well as training in best practices and how to iterate on their findings.
