Penetration Testing Services

This service provides **manual penetration testing** delivered by an experienced penetration tester, designed to identify security vulnerabilities in systems, applications, and infrastructure. Testing is conducted in line with **CREST-approved principles and methodologies**, focusing on real-world attack techniques to assess the effectiveness of security controls.

The service can include, but is not limited to:

- Infrastructure penetration testing (internal and external)
- Web application penetration testing
- API and service testing
- Cloud configuration and platform review
- Wireless and network security testing (where in scope)

All testing is **scoped and agreed in advance** with the customer to ensure alignment with business objectives and risk appetite. The tester uses a combination of manual techniques and supporting tools to identify, validate, and evidence vulnerabilities, prioritising issues based on risk and potential impact.

Deliverables

- A clear, well written penetration test report
- Executive summary which can be used in a non-technical arena, highlighting key risks
- Detailed technical findings with evidence
- Risk ratings and practical remediation guidance
- Post-test clarification and support, if required

Service Characteristics

- Delivered by a qualified penetration tester
- Manual, intelligence-led testing approach
- Aligned with CREST standards and ethical testing principles
- Suitable for public sector environments and assurance needs
- Can be delivered remotely or on-site, depending on requirements

This service supports organisations in understanding their security posture, meeting assurance requirements, and reducing exposure to cyber risk.
