Catellus

Your health & care companion

Unified Diagnostic Record

About us.

Imagine if every diagnostic result—whether it's a pathology report, radiology scan, genomics test, or imaging summary—was no longer trapped in separate systems across departments or hospitals.

Instead, they were brought together into one simple, consistent view, available at the point of care.

At Catellus, we believe your health data should belong to you—not locked away in disconnected systems. We're building a future where every patient has access to a complete, contextualised diagnostic record—under their control, and always available to them and those involved in their care.

Because Results Without Context Miss the Point

Today, diagnostic data is scattered. Labs, scans, and specialist letters exist in silos—each holding only a piece of the story. But clinical decisions rely on context. A result can't be interpreted in isolation: it depends on your symptoms, recent treatments, current condition. Without that, care can be delayed, duplicated, or compromised.

We're changing that.

The Solution – Unified Diagnostic Record

We take fragmented, siloed diagnostic data and weave it into a single, longitudinal record for each patient. That means clinicians no longer need to log into multiple portals, interpret inconsistent formats, or wait on faxes or emails—they get immediate, secure, structured access to everything they need to make fast, informed decisions.

It’s not just about visibility—it’s about safety, speed, and better patient outcomes. And because our platform is lightweight, integration-friendly, secure and built to sit alongside your existing systems, it doesn't require a massive rip-and-replace.

In short: we unify diagnostics so you can unify care.

Even when two trusts use the same digital imaging platform, they often still operate in silos—different instances, separate patient records, inconsistent data visibility. What’s missing is the shared context that enables true cross-organisation collaboration.

That’s where our Unified Diagnostic Record comes in. We bring together diagnostic data—across modalities and across trusts—into a single, longitudinal patient view. Whether a CT scan is done at Trust A, a biopsy at Trust B, and a report written at Trust C, the clinician sees it all in one place, in real time, with a consistent structure.

This goes beyond just ‘access’ to shared systems. It’s about stitching together the narrative of a patient’s diagnostic journey—making it faster to interpret, safer to act on, and easier to coordinate across settings.

The Benefits

Our platform is lightweight, integration-first, and vendor-neutral, meaning we complement—not compete with—your imaging solution.

In essence, we turn your network's infrastructure into a secure, shared diagnostic intelligence layer.

For a Diagnostic Network, this means:

- **Shared workflows** that actually work across sites—not just shared infrastructure.
- **Reduced duplication** of tests and fewer delays due to missing history.
- **Improved MDT decision-making**, with a complete diagnostic context at hand.
- **Stronger data security and governance**, by reducing the need for manual data movement, email sharing, or workarounds that expose PHI—our solution enables secure, policy-controlled access across organisations.
- And **future readiness** for AI, structured reporting, and national interoperability standards.
