

OZONE · HEALTHCARE

Service Overview.

Ozone Health is a UK based digital healthcare technology and care provider with knowledge and experience deploying in both high-pressure emergency situations and in the community. As such our platform supports healthcare professionals consulting and operating in these environments.

Telemedicine:

ozone.healthcare's Telemedicine option is a fully remote service, with the digital consultation platform designed to support clinicians in reviewing and managing up to 80% of patients at home or in their primary care setting. The platform will seamlessly work alongside existing clinical pathways and the NHS e-Referral Service.

Our fully flexible option can be delivered in a way to suit you:

Outsourced:

Use ozone.healthcare in practice, and our team of specialist consultants will review cases and offer outcomes and treatment plans, taking pressure of secondary care consultants.

Joint Sourcing:

Use ozone.healthcare with your own specialists and our team together to boost capacity. Your specialists will get a heads up of the patients they will see face to face, with all remote history already available.

This also means you can plan clinic capacity, matching complicated cases with specialists and simple procedures with appropriate members of your department.

Referral Validation:

ozone.healthcare's Referral Validation option allows NHS Trusts and private providers to increase clinical capacity by enabling efficient review, management, and redirection of referrals.

It streamlines the process of upgrading, downgrading, or returning referrals to primary care, ensuring that patients are directed to the most appropriate resource by facilitating informed decision making and improving referral pathways.

ozone.healthcare helps Trusts and Providers to optimise clinical capacity and enhance patient outcomes.

Telemedicine Devices & Web Technology:

Our compatible state of the art webcam, digital dermatoscope and image capture system allow NHS specialists to be fully involved in the care of patients without having to be in clinic. Using our WebLink technology, patients are connected so they can send in their own images from home.
