

Kompass Consulting – G-Cloud Service Definition

Service Description: Kompass Consulting provides strategic consultancy services to support public sector clients to understand and plan for development of their data capabilities through cloud hosting and cloud software.

Levels of service: Kompass Consulting provides an ad hoc or project based service depending on client needs. We provide expert advice and guidance to understand options for improved data governance and data management to better enable clients to exploit data to achieve their strategic objectives – whether that be public service delivery, policy development or organisational efficiency and effectiveness.

About us: We put data at the heart of policy, system and organisational design, enabling public sector organisations to achieve real impact with tight resources. Our mission is to drive improvement in government and public services through better use of data. We work collaboratively with clients and partners to identify and clear away barriers to progress and bring stakeholders together to deliver agreed, pragmatic, effective solutions. Our founder and director, Katharine Purser has over 20 years' experience leading teams to broker effective solutions to complex public sector challenges, bringing data into the heart of decision making. Katharine is highly experienced in consulting for the public sector and particularly adept at working on client side to get optimum results from projects with larger consultancies.

Our work:

DATA STRATEGY - We help organisations pinpoint the data and data capabilities they need to achieve their strategic goals and help clients design and deliver a data strategy which develop these. We undertake data maturity assessments and advise on how critical data and data capabilities can be improved – using cloud platforms and software where appropriate.

DATA OPERATING MODELS - We work with clients to develop tailored digital and data operating models which recognise the complexities and constraints of the public sector. We have particular expertise in models for multi-agency collaborations and cross-functional teams, and support clients through the implementation process.

POLICY-LED DATA DESIGN - The most effective policies draw together insight from data, people and experts to build long terms sustainable approaches to tackling issues - recognising that real change takes time, consistency and sometimes sheer force of will. We help clients understand the data they need to design and deliver effective policies, and measure their success, and build that into their cloud strategy.
