REDEFINING INTELLIGENCE

BLUEFUSION is a mission focussed Intelligence platform designed to deliver rapid, actionable strategic and tactical insights for intelligence and supporting missions.

BLUEHORIZON AI

BLUEHORIZON converts IOT data, focussing on video, imagery and sensor feeds, supercharged with a specialised AI engine enhanced with intelligent OCR, to instantly provide operational intelligence based on optical feeds alone, without needing to physically connect unrelated and geographically disparate systems. Identify and track people, vehicles and activities, understand movement patterns, detect anomalies and alert from any type of image source, whether it is a drone feed, CCTV, Webcams or covert. For example, at a port of interest, public webcam or client deploying EO capabilities automates the track and targeting of individuals, vehicles and vessels of interest in local AORs.

Our primary Imagery geolocation AI analysis tool has been used in over 1500 cities, across hundreds of cases, saving thousands of hours of Analytical time. This tool enabled a police department to locate a wanted person within 20 minutes of an image being posted to a social media platform, enabling law enforcement officers to locate and arrest the subject. We have included a video as an attachment to allow readers to visualise the power of the AI based software.
