

PRISM is an AI governance and risk management platform that enables organisations to document AI use cases and align engineering and regulatory compliance: from contextual strategy and intent to technical assessments. The platform creates AI development factory 'spaces' in which to operationalise AI development and deployment. It motivates stakeholder contribution and completeness of perspective across the enterprise.

Within PRISM is the synthetic data capability Aizle. Aizle synthetic data accelerates safe AI adoption, development, and deployment through the usage of privacy-, security-, and compliance-safe datasets. Aizle data is available as standalone datasets and generation, or as part of PRISM services. Aizle data is used by the FCA, DBT, Tier 1 banks, and more than 100 organisations to accelerate their data and AI innovation

We provide comprehensive training and support for both PRISM and Aizle, and offer extensive services to get you started: intention workshops, readiness assessments, synthetic data walkthroughs, and rapid AI prototyping.

You will have a named relationship manager available in business hours to manage support and training requirements. PRISM and Aizle are accessible through web browsers, and are deployed flexibly in line with your security and data governance framework. Data retention, deletion, and access is available in line with UK GDPR and the Data Protection Act (2018), or your organisations' specific policies.
