## 1.0 Scope of our services

Successful data migration is the foundation of any clinical system implementation. Success is achieving a high quality of migrated data enabling you to maximise clinical adoption, deliver your project's planned benefits and avoid delays which can impact not just your schedule and costs but operational service delivery.

An essential prerequisite to success is the development of a data migration strategy and what we call 'data profiling'.

This involves understanding the current state of source data and includes a data quality assessment quantifying risks and gaps associated with data in the legacy systems thus enabling a reliable definition of the breadth and depth of data to be migrated. It is key that this stage gains the buy-in of clinical stakeholders in terms of the clinical data that will be available in the new system and that accessible via archives.

Experienced leadership, to co-ordinate Trust clinical, administrative and IT teams and external suppliers, is crucial. Data migration also requires technical expertise in source and target systems and the ability to securely scope and manage data extraction, transformation and load activities. The data migration approach is depicted below:

The significant experience and skills of the team support the entire data migration lifecycle illustrated above including:

- **Leadership:** Managing and leading data migration projects and workstreams end to end, co-ordinating activities and managing risks across Trust and external teams.
- **Strategy development:** Working closely with clinical and non-clinical teams to design a data migration approach and strategy appropriate for the organisation.
- **Data Profiling:** Working with the organisation and suppliers to explore, assess, and audit source data, identify any risks and gaps and determine exactly what needs to be migrated. Planning: Creating and agreeing robust, realistic data migration plans.
- **Extract, transform and load data:** Management of 3rd parties to support ETL alongside and development of the solutions, rules and processes required to migrate data from source to target solutions including the mapping of source to target data and any automated data cleansing.
- **Testing:** Data migration test strategies, test criteria identification, test data preparation and test issue management.
- **Go Live preparation:** Managing "full dress rehearsal" or go live practice which assure data migration timings and prepare staff for the Go Live.

- **Cutover, Go Live and post Go Live:** Managing data migration tasks, including any data catch up, to strict timings to minimise organisational disruption. Support post-Go Live auditing of data.
- **Data Security:** Sensitivity to data protection and security requirements.

The key outcomes we have successfully delivered for our clients include:

- Early engagement of our '**Data Profiling**' migration service has enabled a number of NHS Trusts to fully understand the risks and costs of their projects' data migration workstreams up front. This facilitated accurate scoping and planning of data migration and the wider project.
- Managed a complex data migration workstream underpinning a clinical system roll out at an acute Trust which went live both on schedule and to budget.
- Overcame complex historical clinical data challenges by delivering specialist migration tools and a clinical data viewer, hugely simplifying access to archived data, which remains in use.
- Supported data migration and other key deliverables at multiple Trusts during their EPR go lives. Services included post go-live support/early live support.

## **2.0 Pricing**

Please refer to the associated pricing document/ rate card relevant for this service.
