

CyberArk Secrets Manager, SaaS: Multi-cloud SaaS Secrets Management

Manage non-human access and machine identities for any cloud platform or dynamic environment with a uniform experience.

DATA SHEET

HIGHLIGHTS

Multi-cloud and cloud-agnostic

Build cloud-portable applications and workloads with uniform secrets management interface, regardless of cloud platform, on-premises environments or tools.

Centralized secrets management

Establish centralized control and enforce unified policies over secrets using existing security processes and infrastructure across any cloud platform and on-premises.

Uniform experience for security and developers

Provide a consistent experience across any environment for developers and security.

Reduced vault sprawl

Simplify secrets management across multiple projects and reduce the number of secrets management vaults.

Automated rotation

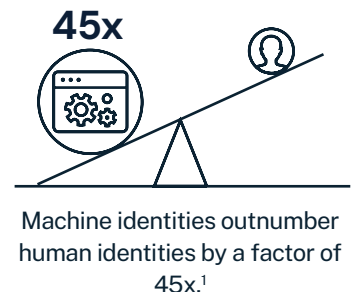

Facilitate automatic rotation of secrets with cloud-native secrets managers.

The Challenge

The modern enterprise organization needs to secure non-human access across multiple software infrastructure environments that include a mixture of on-premises and cloud providers. The applications and cloud workloads within these environments leverage secrets to perform automated tasks. These secrets grant non-human actors access to some of the sensitive company resources and databases. At a typical company, non-human access can outnumber human access 45 to 1, so secrets are everywhere.

Security teams have more infrastructure to secure and fewer hardware and staff resources to dedicate to implementing and maintaining various bespoke secrets management solutions across different environments and vendors. Security teams are looking to consolidate with one solution to manage non-human access holistically, regardless of cloud platform.

¹ CyberArk, "2022 Identity Security Threat Landscape," April 2022.

KEY BENEFITS

- Extend privileged access management for human credentials to include non-human identities.
- Enable Zero Trust security by authenticating, authorizing and auditing machine-to-machine access to secrets and credentials.
- Protect against software supply chain attacks and provide CI/CD pipeline security by removing hard-coded secrets from tool scripts and configuration files that put the software supply chain at risk.
- Eliminate the “secret zero” problem and establish machine identity by leveraging the native attributes of applications, containers and other non-human identities.

The Solution

CyberArk Secrets Manager, SaaS (formerly known as CyberArk Conjur Cloud Secrets Manager) is a modern secrets management solution, designed to simplify and streamline the management of non-human secrets and credentials wherever they are, in any cloud or environment. With Secrets Manager, SaaS, security teams and developers can use the same secrets management solution for any cloud platform or even on-premises, reducing the impact of cloud vendor lock-in and enabling organizational resources to be more dynamic and flexible.

This SaaS-based secrets management solution allows for hardware and human resources to be focused on delivering more business value, accelerates deployment time and streamlines software maintenance with automatic updates. This means quicker time-to-value and lower total cost of ownership.

As a part of the CyberArk Identity Security Platform, Secrets Manager, SaaS can seamlessly integrate with CyberArk Privilege Cloud and easily leverage the Identity Security Platform Shared Services to enable operational efficiencies, with unified audit and Identity Security Intelligence.

Benefits

CyberArk Secrets Manager, SaaS enables organizations to:

Simplify and centralize secrets management across hybrid and multicloud environments. Manage secrets within any cloud or on-premise environment without creating security islands or need for developers or security teams to learn multiple secrets management tools. With Secrets Manager, SaaS, you can manage, enforce and audit non-human access in one place.

Reduce staff training and maintenance cost. With Secrets Manager, SaaS, there is a single uniform experience for development, DevOps and security teams, and software updates are handled automatically.

Build cloud-portable applications. There is no need for developers to write and maintain specialized secrets management code that depends on the current cloud provider being used or if the application is hosted on-premises.

Faster time-to-value. Security teams can quickly deploy their new secrets management solution because there is no secrets management hardware or software to host.

About CyberArk

CyberArk (NASDAQ: CYBR) is the global leader in identity security, trusted by organizations around the world to secure human and machine identities in the modern enterprise. CyberArk's AI-powered Identity Security Platform applies intelligent privilege controls to every identity with continuous threat prevention, detection and response across the identity lifecycle. With CyberArk, organizations can reduce operational and security risks by enabling zero trust and least privilege with complete visibility, empowering all users and identities, including workforce, IT, developers and machines, to securely access any resource, located anywhere, from everywhere.
