

Amazon CloudFront pricing

Deliver fast and secure applications on AWS for a monthly price with no overage charges.

Flat-rate pricing plans

CloudFront flat-rate pricing plans combine the Amazon CloudFront global content delivery network (CDN) with multiple AWS services and features into a monthly price with **no overage charges**.

Flat-rate pricing plans include the following for a monthly price:

- CloudFront CDN
- AWS WAF and DDoS protection
- Bot management and analytics
- Amazon Route 53 DNS
- Amazon CloudWatch Logs ingestion
- TLS certificate
- Serverless edge compute
- Amazon S3 storage credits each month

Start with the \$0/month Free plan and upgrade to access more capabilities and larger usage allowances.

Description	For hobbyists, learners, and developers getting started	Launch and grow small websites, blogs, and applications.	Protect and accelerate business applications.	Scale and protect business and mission-critical applications.	Connect with a specialist for custom pricing.
Monthly price	\$0/month No overage charges	\$15/month No overage charges	\$200/month No overage charges	\$1,000/month No overage charges	Custom
DNS	✓	✓	✓	✓	✓
Always-on DDoS Protection	✓	✓	✓	✓	✓
CDN	✓	✓	✓	✓	✓
Web Application Firewall (WAF)	Protect against common web threats	Use-case protections like PHP, WordPress, and SQL	Advanced protections	Advanced protections	Advanced protections

Each plan includes a monthly usage allowance designed for optimal performance at that tier. Select a plan where the monthly usage allowance accommodates your baseline traffic on both requests and data transfer. If your usage exceeds the allowances in your CloudFront Flat-rate Pricing Plan, AWS may take appropriate action, which may include reducing your performance (for example, serving your traffic from fewer or more distant edge locations, reducing throughput, or

Benefits

Why customers choose CloudFront flat-rate plans.

Start with everything you need

Get CloudFront's global CDN, WAF, DDoS protection, DNS, TLS certificate, logging, and serverless edge compute in one plan for a monthly price. Plus receive monthly S3 Standard storage credits. Start delivering content without calculating costs across multiple AWS services. Security features are enabled by default, and additional configurations are simple to set up.

No overages

There are no additional overage charges or usage calculations, even during traffic spikes or attacks.

Protect against DDoS attacks

AWS infrastructure does the heavy lifting of absorbing and blocking attacks before they reach your infrastructure. Reserve your compute, database, and infrastructure only for legitimate traffic. Blocked DDoS attacks and requests blocked by AWS WAF never count against your usage allowance.

Reduce your overall AWS costs

Data transfer between CloudFront and your AWS origins is automatically waived when serving traffic through CloudFront, giving you a monthly price for both CloudFront delivery and your AWS origin's data transfer costs to CloudFront. When cached content is served from CloudFront edge locations or regional edge caches, duplicate requests are collapsed, and unwanted traffic is blocked, you'll see fewer requests hitting your origin servers, databases, and other AWS services that charge based on usage—reducing your costs.

FAQs

What is CloudFront and when should I use it?

CloudFront is a content distribution network that serves as a single point of entry for your application globally. Viewers anywhere in the world connect to one of CloudFront's hundreds of edge locations nearest to them: CloudFront either responds directly from its cache or forwards the request to your application. Because traffic is spread across CloudFront's edge locations, you can leverage CloudFront's network architecture to deliver low latency applications that can withstand large bursts of traffic or sustained traffic as compared to web applications served from single locations. This makes CloudFront the ideal place to protect against DDoS and other application attacks.

Consider CloudFront for any publicly accessible web application where you need performance, security, and availability. Your web application can be hosted on AWS—like S3, AWS Application Load Balancer (ALB), or Amazon API Gateway, or on any publicly accessible URL. Your content can be static, dynamically generated and cacheable, or non-cacheable content — all three will benefit from improved performance, security, and availability.
