

Asset Management

See, protect and optimise every asset you rely on

WHY ASSET MANAGEMENT MATTERS

Your organisation depends on assets being safe, compliant and available. From equipment and plant to vehicles and other critical assets, poor control can lead to safety incidents, unexpected failures and unnecessary cost.

Spreadsheets and disconnected systems make it hard to know what you own, where it is, its current status and whether statutory checks are up to date.

The Asset Management module brings this information together in one place. You can see the assets you rely on, understand their history and condition, and plan inspections, maintenance and replacement before issues arise.

KEY FUNCTIONS

Build a complete asset register

Create structured records for physical and intangible assets, capturing key details such as type, location, supplier, model, serial number, purchase and warranty information. Use categories and filters so assets are easy to find and manage.

Track condition, inspections and maintenance

Record condition, test results and maintenance history against each asset. Log inspections, services and repairs so you always know what has been done, by whom and when it's due again.

Schedule planned inspections and servicing

Set planned inspection and maintenance schedules for critical assets. Assign tasks to responsible people, add due dates and use reminders to make sure statutory checks and servicing are never missed.

Manage documents and certifications

Store associated documents such as manuals, certificates, test records and service reports with the relevant asset. Keep everything in one place so you can quickly provide evidence to auditors and regulators.

Monitor status and performance

Use dashboards and summary views to see asset status at a glance – including overdue inspections, upcoming maintenance, and assets approaching end of life. Focus effort on what matters most.

PROACTIVELY MANAGE ASSET MANAGEMENT

AssessNET gives you a single, cloud based view of risk, compliance and performance. Asset Management fits alongside your wider health, safety and risk modules so you can see how assets, people and processes interact.

Dashboards, reports and notifications keep you ahead of expiring inspections, overdue tasks and emerging issues, helping you protect people, meet your obligations and get the best from every asset you own.
