

# Accident & Incident

Capture what happens, understand why and stop it happening again

## **WHY ACCIDENT & INCIDENT MANAGEMENT MATTERS**

**Every incident is a chance to prevent the next one.** If events are under-reported, poorly investigated or tracked in disconnected systems, you lose vital insight into where people are being hurt, where controls are failing and where culture needs support.

Paper forms, email chains and spreadsheets make it hard to see trends, follow up actions or demonstrate that you are meeting your legal and organisational duties.

With AssessNET, you can encourage timely reporting, standardise investigations and keep a clear audit trail from first report through to close-out, helping you protect people and evidence good governance.

## **KEY FUNCTIONS**

### **Capture incident and near misses in one place**

Use simple, configurable online forms so employees and contractors can report incidents, injuries, property damage and near misses quickly and consistently.

Capture key facts such as what happened, where, when, who was involved and any immediate action taken.

## Classify events and understand impact

Record event types, severity, injury details, lost time and other key fields so you can analyse patterns and meet internal and external reporting requirements.

## Support structured investigations

Guide managers and H&S teams through a consistent investigation process. Record root causes, contributing factors and lessons learned, and attach photos, witness statements and documents to build a complete picture.

## Create and track corrective actions

Raise actions directly from incidents and investigations, assign owners and due dates, and track progress through to completion. Ensure nothing is closed until appropriate evidence has been reviewed.

## Manage regulatory reporting

Capture the information you need for statutory reporting and use it to support the completion of any external notifications, ensuring data is accurate and traceable.

## Analyse trends and hotspots

Use dashboards and reports to identify recurring incident types, high-risk locations, activities, equipment and roles. Focus your time and resources on the areas that will deliver the greatest reduction in harm.

## PROACTIVELY MANAGE INCIDENTS

**AssessNET brings all your incident and accident data into a single, cloud-based platform.** Dashboards, notifications and configurable reports help you stay on top of new reports, investigations and actions, and provide clear insight for leaders and safety teams.

By making it easy to report, investigate and learn from what happens, you can move from reactive problem-solving to proactive prevention, reducing harm, improving culture and giving stakeholders confidence in how you manage risk.
