

Review

Review delivers fast, unified access to clinical results and correspondence, helping clinicians interpret, manage, and act on patient information efficiently.

Clinicians are under pressure to reconcile results from multiple systems while maintaining complete traceability. Review provides a single, configurable, web-based environment for viewing patient test results, investigative reports, requests, and clinical correspondence. With powerful search, contextual summaries, charting, sign-off workflows, patient tracking, and full audits, Review supports faster and more reliable results management across primary and secondary care settings while respecting local configurations, roles, and permissions.

Review brings together pathology and radiology reports, test requests, clinical correspondence, and patient summaries into a single intuitive interface, reducing time spent searching across multiple systems.

The platform offers powerful search tools – basic, advanced, compound, and one-click – making it easy to locate patients, reports, or specific items of interest. Configurable summaries provide a clear view of patient histories, with interactive charting for trend analysis and anomaly detection. Clinicians can track patients, manage lists, and streamline workflows with batch sign-off and customised views.

Review supports safe clinical practice through infection flags, severe result alerts, and complete audit trails, ensuring full traceability. Integration with tQuest enables end-to-end visibility of requests and investigations. Role-based access and administrative configuration ensure the system adapts to local workflows and governance requirements.

Overall, Review improves clinical efficiency, enhances decisions, and strengthens patient safety by bringing critical information together in one accessible, context-rich environment.
