Transformative Solutions for Healthcare Data

By harnessing the power of your data, we enable you to make informed decisions, drive innovation, and improve patient care. We optimise every step of the data lifecycle for the greatest impact, giving you tangible value and return on investment.

Based on our extensive experience of using data in healthcare, our services provide end-to-end support in capturing high quality data to generate actionable intelligence - from advice and guidance on improving data quality, through to the use of tools, including AI where appropriate, to optimise the interpretation of that data.

We can help ensure data flows between your systems smoothly.

We understand health and social care from the grassroots up. We know that achieving interoperability and integration between solutions, across a health and care system, are two of the most important things that will allow clinicians to provide the best possible care – it's a top priority for NHS and Social Care organisations.

We provide integration solutions within public and private healthcare and social care settings. We not only integrate systems within a single organisation, but also systems between the two disciplines of social care and healthcare.

Our team understands how data and information generated by one solution could be made available and be used by other solutions in meaningful ways, whether they are based on different technologies. We are experienced in standards such as FHIR, HL7 v2, HL7 v3, CDA, UN-EDIFACT (PMIP), proprietary formats and database connections and have implemented interfaces with central solutions such as MESH, MIG, PDS.
