

Data Migration Services

Transformative Solutions for Healthcare Data

By harnessing the power of your data, we enable you to make informed decisions, drive innovation, and improve patient care. We optimise every step of the data lifecycle for the greatest impact, giving you tangible value and return on investment.

Based on our extensive experience of using data in healthcare, our services provide end-to-end support in capturing high quality data to generate actionable intelligence - from advice and guidance on improving data quality, through to the use of tools, including AI where appropriate, to optimise the interpretation of that data.

We help protect the security and integrity of your data when moving it to a new location, archive or system.

We are experienced in migrating NHS data and are familiar with healthcare data relationships and terminology. We map source data to the new target system and lead joint working between teams to agree completed mappings, complete outstanding mappings, and identify and subsequently resolve outstanding queries where there are gaps in the source data.

This activity informs the scope and approach and will include key assumptions regarding data derivation/default values required by the target systems but not available within source data. These will all be clearly documented and signed off at each key stage.

Decisions regarding scope, source and mappings often change during the project. Testing of migrated data against new workflows may identify reliance on seemingly insignificant pieces of information not currently sourced. Where this is the case Integrus have worked with users to identify how to source or derive the information and identify how it can be maintained to provide an easier transition to new workflows. Iterative changes to scope and source are fully supported throughout the DM project.
