

Jodami: Secure video, voice & chat

The ability to share information securely is paramount for all organisations. Being able to collaborate, even with your most valuable information, gives your organisation its competitive advantage and keeps you one step ahead.

Surevine's mission is to develop great collaboration tools for people working within organisations where security really matters.

Jodami provides a cohesive user experience to allow participants to securely hold voice and video calls and send private and group chat messages, customisable to your needs. It has security controls that are designed to be scaled to match the requirements of any security-conscious organisation. It can be hosted anywhere, for example on a secure private cloud or public cloud infrastructure, allowing you to take back control of your organisation's communications.

As Jodami is deployable anywhere, levels of service and quality of calls are made more reliable by simply increasing the underpinning dedicated compute resource. With a huge increase in the amount of voice and video calling for both work and personal life from home, other services are being put under pressure, reducing quality, however Jodami remains private and secure, as you do not have to share resources.

We draw on the intuitive and familiar models of Instant Messaging (IM), chat rooms, video conferencing and voice calls, that users will already be familiar with. This makes Jodami straightforward for organisations to adopt and use. Surevine also delivers a secure approach to messaging and video conferencing that enforces your information sharing rules whilst still actively encouraging collaboration and participation.

Jodami is designed to be customized and scale to your needs, meaning you are not at the mercy of a vendor's roadmap. Jodami can be accessed through any modern browser and there is support for native applications.

Approach

Surevine's reputation for being a trusted partner explains our exceptionally high rates of client retention. We are acknowledged leaders in our area of expertise and yet our clients can rely on us to be as honest about *what we can't do*, as what we can do better than anyone else.

We gain that trust through a Way of Working which is founded in deep domain expertise, technical excellence, security by design and ensuring that genuine user needs drive everything we do.

Our open approach

To deliver seamless collaboration, our solutions have to be interoperable. We achieve interoperability through active participation in standards bodies (e.g. XMPP). Our active participation ensures that everyone benefits from better security from the contributions we make on behalf of our clients, right down to the protocol level.

Surevine are also active participants in the reference implementations of those standards, often open source projects. Being open delivers other advantages: open to scrutiny for security vulnerabilities; ease of adoption allowing for wider participation; and a maintainable approach to security hardening.

Why Surevine?

- Identified as one of the UKs leading Cyber Security businesses by a former UK Prime Minister
- Recognised as a thought leader in cyber security information sharing and cross-domain solutions
- We design, build and support secure collaboration environments for the National, Homeland and Cybersecurity domains and those organisations with the most demanding security requirements
- Play an active role in interoperability and open standards
- Focused on the development of secure collaboration solutions, bringing the user experience you expect as a consumer to the workplace
- Security influences everything we do. We develop systems that our clients can trust, following a secure development lifecycle
- Surevine is a key supplier to UK Government and industry and were one of the first accredited cyber security suppliers to UK Government
- ISO2700 and Cyber Essentials certified
