

Modular Configuration and Service Options

Due to the modular nature of the CheckPoint product suite, pricing is structured to provide flexibility based on specific customer requirements. This ensures a tailored solution where costs are aligned with selected capabilities and support levels.

- **Modular Product Selection:** Total pricing is determined by the specific combination of CheckPoint modules selected to meet the customer's objectives.
- **Complementary Services:** Pricing accounts for various complementary products and integrated features designed to enhance the core CheckPoint deployment.
- **Support and Maintenance:** We offer a range of ongoing support and maintenance tiers, allowing customers to choose the service level that best fits their operational needs.
- **Scalability:** As a strategic partner, Computacenter provides access to the full range of CheckPoint products and services available throughout the term of the G-Cloud 15 framework, ensuring the solution can evolve with the customer's requirements.

All final configurations and associated costs will be governed by the publicly available list price for CheckPoint on their corporate web site coupled with the maximum price caps and discount structures defined within our G-Cloud 15 framework.
