# Cyber Risk Reviews from 2T Security

2T Security has been delivering Cyber Risk Reviews (CRRs) to clients for many years, especially for Critical National Infrastructure (CNI). We have a team of consultants experienced in Information Technology and Operational Technology (IT and OT) who will run security architecture and risk analysis workshops that explore the cyber-related risks of key technical platforms.

Our CRRs are based around the NCSC's Cyber Assessment Framework (CAF).

## Capabilities

- Rapid understanding of technical architecture for both IT and OT systems
- Ability to map CAF outcomes to existing systems and processes
- Strong report-writing skills to deliver high-value output
- Create business-focused recommendations that can be linked into existing project management and planning activities

## Key benefits

- Formal documentation of CRR findings, helping customers with business case justifications for cyber improvements.
- Clear set of recommendations for identified risks and issues, set out in standard format linked to the CAF.
- Services led by UK Cyber Security Council Chartered Security Professional and/or NCSC assured Head Consultant

## Engagement Process

Our team will include a Project Manager as well as technical experts, so we will manage the entire engagement. We can liaise with stakeholders across the business, and manage the workshop scheduling. A CRR will typically involve two days on-site for the workshops, after which we will analyse the data collected and draft the report. This will be provided for review and comment. We will then update and finalise the report, and present our findings and recommendations.
