

datb – AIMS Asset Information Management System Pricing for G-Cloud 15

version	1.0
date	20 th December 2025

1 Overview

AIMS is delivered as software-as-a-service (SaaS) and is priced annually on a *per-instance* basis, where an instance is a production implementation of the AIMS system.

The overall annual cost covers:

- a licence and support component
- hosting / infrastructure management costs.

Costs include:

- support, maintenance, monitoring, ongoing product enhancements
- security management
- disaster recovery planning & testing

There are optional separate modules that can be deployed within the overall AIMS environment; these are costed separately.

2 Annual costs

The annual cost for an AIMS instance is £140k.

This is deployed within Oracle Cloud Infrastructure (OCI) which is a robust, reliable, secure and cost-effective platform. All data is maintained within the UK.

3 Onboarding costs

There are no onboarding costs relating to the establishment of the AIMS application for a client organisation. However, it is to be expected that some costs may be incurred in respect of data loading where this is required, also for initial administrative training / familiarisation activities. These costs may be charged on either a T&M or fixed-price basis – please contact us to discuss requirements.

4 Optional module costs

LARMS (Land Access Requests Management) - £70k per annum.

Work Management (includes Offline Forms capability) - £75k per annum.

5 Support and Service Management

Support (included within the annual cost) is available via email / online portal during business hours.

Our service management team employs automated monitoring of services to proactively identify issues.

Server infrastructure and the AIMS application itself are subject to regular routine patching and enhancement as part of our ongoing improvement process.
